

Java FSD - Day 6 Summary

For Loop

- A for loop is used to execute a block of code repeatedly.
- Syntax: `for(initialization; condition; update) { statements }`
- Initialization runs only once.
- The condition is checked before each iteration.
- The update expression increments or decrements the loop variable.
- The loop stops when the condition becomes false.
- For loops are commonly used for printing numbers, odd/even series, and patterns.

Execution Steps

- 1 Initialize the variable.
- 2 Check the condition.
- 3 Execute the statements inside the loop.
- 4 Update the variable.
- 5 Repeat until the condition becomes false.

Handwritten Notes

DAY - 6

2025
JANUARY

Saturday 25

For Loop:

Syntax:

```
for (initialization; condition; update)
{
    // statements
}
```

1. Initial
2. Condition check
3. Increment
4. Print
5. Update
6. Check Condition
- or Print

1, * - initial

+, - - Initial

Total output
count is odd
number
